

METHODOLOGY & ARCHITECTURE

THE PROBLEM & THE SOLUTION

The Problem

- Cybercrimes against women suffer from severe under reporting due to stigma, and lack of jurisdictional awareness.
- Traditional mechanisms are slow, intimidating, and lack forensic intelligence.

The Solution

- A secure, anonymous, and jurisdiction-aware reporting platform.
- Bypasses intimidation by automating legal mapping and evidence structuring.
- **ZERO-TRUST DATA VAULT IMPLEMENTATION:** Use of AES-128-CBC encryption within a Zero-Trust architecture to mathematically map threat information to legal penal codes, while protecting all victim Personally Identifiable Information (PII).

FORENSIC ESCALATION ROUTING

- **SHA-256 Chain of Custody:** All evidence is hashed at upload. Append-only audit logs track every view, download, and verification to ensure legal admissibility.
- **Geo-IP Routing:** The system silently captures victim state-level location upon submission.
- **Dynamic Law Enforcement Escalation:** When an analyst clicks "Escalate", W-CERT automatically injects the exact contact details (Nodal Emails & Landlines) for the specific State's Cyber Crime Cell.

FUTURE SCOPE

- Multi-Lingual Interface Support for pan-India accessibility.
- Integration of decentralized blockchain evidence vault (e.g., Filecoin/IPFS) for immutable chain of custody.
- Deployment of Localized Rapid Response Teams (RRTs).
- AI-driven psychological triage support and legal aid referral network integration.
